

1 Remove smartclient 8.0

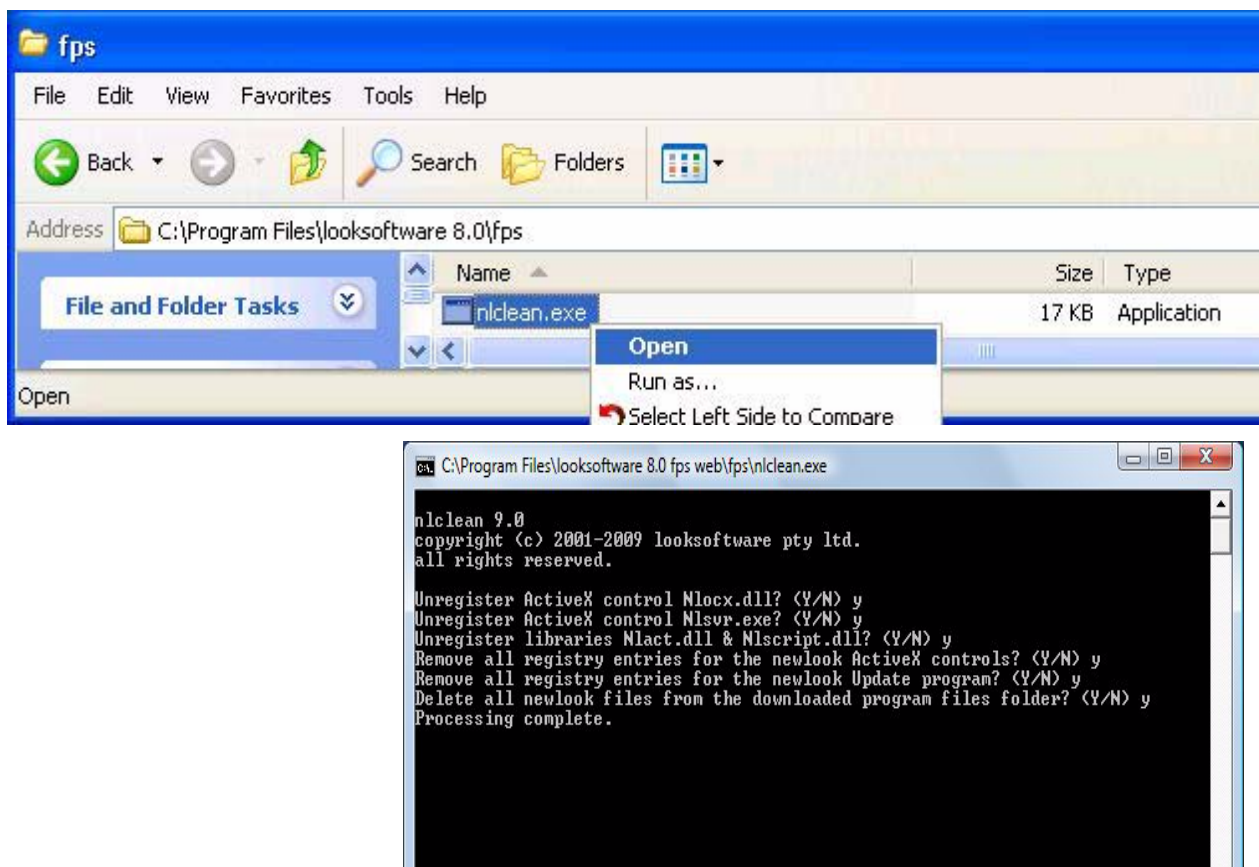

1. If the desktop version (Windows client) was installed, a user with Administrator permissions is required to uninstall it from the Control Panel using the Add/Remove Programs option. All of the version 8.0 variations are included together within looksoftware suite 8.0

2. Follow these remaining steps, as an administrator, to achieve complete removal of all facets of web deployment. “Web Deployment” in this case includes downloading the FPS repository via the internet.
3. As an administrator, remove the registry entries for the ActiveX control.

The ActiveX control has been registered if any web deployment has been done. Web deployment includes installation of the web client or retrieval of FPS updates from the windows client.

Double-click on the nclean.exe program. It is located in the **Program Files\looksoftware 8.0\fps** folder or if the web client was deployed, the **Program Files\looksoftware 8.0 fps web\fps** folder.

Enter “y” for each of the options.
